MFW MOBILE APP

Statement of Work

Prepared for Metal Forming World (MFW)

17 October 2026 | Sanika Attarde

This Statement of Work sets out what will be built for the Metal Forming World (MFW) mobile app, how each stage is approved, and what each side must do. It accompanies the Commercial Proposal dated 17 October 2026, which sets the fee and the payment terms.

Client	Metal Forming World (MFW)
Developer	Sanika Attarde
Product	Mobile app for Android and iOS, backend services and web admin panel
Duration	8 weeks, from kickoff on Monday 16 November 2026 to store submission on Friday 8 January 2027
Fee	₹85,000 fixed, as set out in the Commercial Proposal

Objectives

The project has five goals:

- Give readers an interactive digital edition of the magazine on Android and iOS.
- Let readers download issues and read them offline.
- Show MFW's industry news in the app without duplicating the WordPress site.
- Reach readers directly with notifications about new issues and expo announcements.
- Give MFW's editors a simple admin panel so they can run the app without developer help.

Scope included

Area	What is included
Design	UI/UX design on MFW's branding, with screens approved by MFW before development
Reader	Latest issue and an archive of four to six past issues. Swipe and zoom reading, a page-turn effect, and a two-page spread on tablets and in landscape. Offline downloads with progress, resume and a size warning. Page bookmarks, favourites and sharing.
Discovery	Search by title, description and category. Category and industry filters. Year and edition filters.
Accounts	Guest browsing with a public sample. Email and password sign-up with email verification, password reset and in-app account deletion. Optional sign-up for edition update emails.
News	News list and article pages from MFW's WordPress site, with categories, images, dates and saved articles for offline viewing
Notifications	Permission prompt and preferences by category. Sending from the admin panel, tap-to-open links, a breaking-news alert from a WordPress post, and a send log.
Admin panel	Secure login, PDF and cover upload with checks, issue details, categories, publish and unpublish, app-level news controls, and a subscriber list with CSV export

Area	What is included
Platform	One codebase for Android and iOS. Backend on MFW's own Firebase project with security rules. Crash reporting and basic usage events.
Release	Signed builds, store listings and submission to Apple and Google, source code, documentation and an administrator training session

Scope not included

Naming exclusions early protects both sides. The fixed fee does not cover the items below. Anything on these lists can be added later through a change request.

Later-phase features

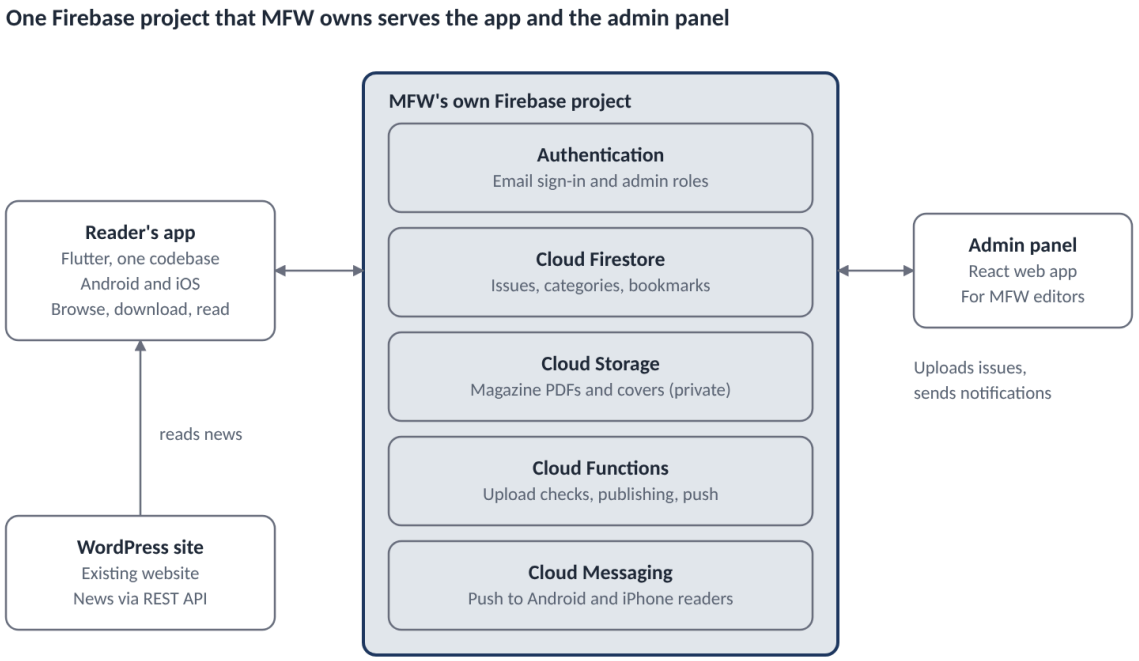

- Google and Apple sign-in
- Reading an issue before the full download finishes (server-prepared page images)
- Scheduled notifications, audience segments, and delivery and open statistics
- A readership analytics dashboard
- Editorial roles, draft and review, scheduled publishing and an audit log
- Shared links that open the app directly
- Lead capture forms and sponsor placement slots

Other exclusions

- Payments, subscriptions and paywalls. Every edition is free to registered readers.
- A public web version of the reader. The admin panel is the only web interface.
- Changes to the WordPress site, and writing news inside the admin panel. News stays in WordPress.
- Marketplace and community features, AI features, advertising platforms and enterprise analytics.
- Integrations with CRM, email-marketing, accounting or ticketing systems.
- Creating or preparing content, and entering production issues, news and notifications. MFW's team does this.
- Languages other than English.
- Legal documents such as the privacy policy. MFW supplies them and the developer implements consent and deletion.
- Copy protection beyond login gating and private storage. The app does not include DRM.
- Third-party charges, an independent penetration test, and devices outside the agreed test list.
- A guarantee of store approval or its timing. Apple and Google decide.
- Support after the 30-day warranty. Optional plans are in the Commercial Proposal.

Proposed technical architecture

The app runs on a managed cloud platform that MFW owns, and MFW's existing WordPress site stays the home of news. Everything sits on MFW's own accounts, so MFW controls its data and can change developers at any time.

Notifications reach iPhones through Apple's push service, which Firebase Cloud Messaging calls on MFW's behalf.

Components

Component	Technology	What it does
Mobile app	Flutter, one codebase for Android and iOS	Library, reader, offline downloads, news, accounts and notifications
Accounts	Firebase Authentication	Email and password sign-in, email verification, password reset and admin roles
Database	Cloud Firestore	Issues, categories, bookmarks, favourites, preferences and the update list, protected by security rules
File storage	Cloud Storage for Firebase	Magazine PDFs and covers. Full issues can be read only by signed-in readers with a verified email
Server logic	Cloud Functions	Upload checks, publishing, sending notifications and account deletion
Notifications	Firebase Cloud Messaging	Delivers notifications to readers who opted in, on Android and iOS
Admin panel	React web app on Firebase Hosting	Lets MFW's editors manage issues, categories, subscribers and notifications
News	WordPress REST API on MFW's site	Supplies posts, categories and images. News is still written in WordPress
Monitoring	Firebase Crashlytics and Analytics	Crash reports and basic usage events

How the main flows work

1. **Publishing an issue.** An editor uploads the PDF and cover in the admin panel. A Cloud Function checks that the file is a genuine PDF within the size limit (150 MB by default), stores it privately and saves the issue details to the database.
2. **Browsing and news.** The app reads the issue list from the database and news from WordPress. Recent articles are cached and requested in small pages, so the app does not overload MFW's website.
3. **Reading.** A signed-in reader with a verified email downloads an issue to the phone's private storage. The download resumes after an interruption and can be deleted from a Downloads screen. Guests see only a public sample.
4. **Notifications.** A notification sent from the admin panel is checked by a Cloud Function and delivered to readers who subscribed to that category.
5. **Monitoring.** Crashes and basic usage events are reported to Firebase.

Why this design

- **One codebase.** Flutter lets one build serve both Android and iOS, which suits the budget and the eight-week plan, and gives the page-turn reader the same behaviour on both.
- **One platform for the backend.** Firebase puts accounts, data, storage, server logic and messaging in one console with official Flutter plugins. An AWS-based design was considered. It needs more parts and more time, with no benefit at launch volumes.
- **News stays in WordPress.** The website is unchanged and no news is typed twice.
- **Reader.** A native page-turn reader with a plain swipe mode as its fallback. No paid component is used unless MFW approves it in writing.
- **Security.** All traffic uses HTTPS. Security rules let a reader see only their own bookmarks and favourites, and only admin accounts change the catalogue.
- **Known trade-offs.** Firestore and Authentication are Google services, so a thin data layer in the app limits the cost of moving later. There is no CDN at launch, so readers download an issue before reading it. Cloud Storage and Cloud Functions need Firebase's pay-as-you-go plan, billed to MFW at actual use.

Deliverables and milestones

Each milestone ends with a demonstration or delivery that MFW approves in writing. Email is enough. The next stage starts once the approval is given and the milestone invoice is paid.

Milestone	Date	Developer delivers	MFW approves when
M1. Kickoff	Mon 16 Nov 2026	Requirements and architecture note, repositories set up, kickoff meeting held	MFW approves the note in writing, names its approver and deputy, and supplies brand assets
M2. Design approval	Fri 27 Nov 2026	Approved screens, interactive prototype, and the result of the reader test on MFW's PDFs	MFW approves the screens. The reader approach is confirmed, or an agreed alternative is recorded.
M3. Core app and backend	Fri 11 Dec 2026	Demo build on Android and iOS test devices with sign-up, login, catalogue and the first reader, running on MFW's Firebase project	A tester can sign up, log in, browse the catalogue and open an issue in the reader on the demo build. The full criteria AC-1 to AC-3 apply at acceptance testing
M4. Feature-complete build	Fri 25 Dec 2026	Test builds with every included feature, admin panel live, notifications working end to end, internal test summary	Every feature in this document is present, and no critical defect is open

Milestone	Date	Developer delivers	MFW approves when
M5. Approval and store submission	Fri 8 Jan 2027	MFW-approved build submitted to Apple and Google, release package, source code, documentation, administrator session, test evidence	MFW signs off acceptance testing, and the handover checks (AC-11 and AC-12) are met

M5 is complete at submission. It does not wait for Apple or Google to finish their review.

Acceptance criteria

Every criterion can be observed by a tester and marked pass or fail. The reader targets in AC-2 are confirmed at the end of Week 2, after testing on MFW's sample PDFs.

No.	Area	The app passes when
AC-1	Browsing and search	The latest issue and four to six archive issues show cover, title, date and description. Category, year and edition filters and search return the right issues. An issue published in the admin panel appears after a pull-to-refresh, with no app update.
AC-2	Reader	A downloaded sample issue shows its first page within 3 seconds on the mid-range test phone. Pages turn by swipe or tap. Pinch zoom to 300% shows sharp text. Tablets and landscape show two pages. Twenty page turns in a row cause no crash. A damaged file shows an error with a retry option.
AC-3	Accounts	A new reader registers, receives a verification email and can then open a full issue. Guests and unverified readers see a sign-in prompt, and a direct request for the PDF file is refused. Password reset works. Deleting the account removes the reader's data.
AC-4	Offline downloads	Downloads show progress, open and read fully in airplane mode, and resume after a network break. The file size is shown and a warning appears on mobile data. Deleting a download frees its space.
AC-5	Bookmarks and favourites	A bookmark opens the issue at its page. Favourites update at once. Both appear after signing in on a second device. A reader cannot see another reader's items.
AC-6	Sharing	Sharing an article or an issue opens the share sheet with its title and link.
AC-7	News	The news list shows the latest WordPress posts with image, title, date and category. A new post appears after a refresh. Category filters work. Articles already loaded stay readable offline, with a notice.
AC-8	Admin panel	Wrong passwords and non-admin accounts are refused. A valid PDF uploads. A renamed non-PDF or an oversized file is rejected with a clear message. Categories, publishing, unpublishing and hidden news posts show correctly in the app after a refresh. The subscriber list exports to CSV.
AC-9	Notifications	The app explains notifications before the system prompt. A category notification reaches only devices that chose it, and tapping it opens the linked issue or article. The send log records each send. Only admins can send. Delivery time depends on Apple and Google and is not guaranteed.
AC-10	Testing	A test plan is run and results are recorded for every criterion above. The test phones are agreed at M1: one low-cost and one mid-range Android phone, an older and a current iPhone, and a tablet where available. The security checklist is completed. No critical or high defect is open when acceptance testing starts.
AC-11	Release	Signed Android and iOS builds are made from tagged source code. Store listings carry text approved by MFW. The privacy details in both stores match MFW's privacy policy. Both builds are submitted and MFW receives the confirmations.

No.	Area	The app passes when
AC-12	Handover	Source code with history is in a repository owned by MFW. Following the written documentation, the developer builds the app and deploys the backend from a clean copy into a fresh Firebase project. Credentials are held by MFW.

How acceptance testing works

1. The developer delivers the test build and a test script at the start of Week 7 (Monday 28 December 2026).
2. MFW has five working days to test and log defects.
3. The developer replies to each item within one working day: a defect, a change request, or not reproducible.
4. Defects are fixed in regular builds. MFW checks each fix within two working days.
5. Acceptance is signed off when no critical or high defect is open. Medium and low items are fixed, or agreed in writing for the warranty period.

A **critical** defect stops the app working or exposes data. A **high** defect means a confirmed feature does not work and there is no workaround. **Medium** means a visible fault with a workaround. **Low** means cosmetic.

Responsibilities

I will

- Design, build, test and deploy the app, backend and admin panel on MFW's own accounts.
- Submit the app to Apple and Google, and hand over the source code and documentation.
- Commit work to MFW's repository every week with short written notes.
- Tell MFW in writing as soon as a delay is expected, and absorb delays caused by the developer.
- Correct defects at no charge during the build and the 30-day warranty.

MFW will

- Name one authorised approver and one deputy. Approvals count when given in writing by either, and email is enough.
- Supply the items listed under "What we need from MFW" in the Commercial Proposal, by the dates shown there.
- Send one consolidated feedback list for each review round.
- Review a milestone within three working days, a test build within two, and acceptance testing within five. If there is no reply, the developer sends a reminder, and after two more working days the deliverable is treated as approved. Written feedback always restarts the review.
- Own and pay for the Firebase project, the Apple and Google accounts and any domain, and give the developer access through each platform's role-based access, not shared passwords.
- Provide and enter the production content, and supply the privacy policy and terms of use.

A delay of one working day on a key item, such as brand assets, sample PDFs, WordPress access, the Firebase project, store accounts or launch content, moves the later dates by one working day. A delay longer than five working days is handled as a schedule change and agreed in writing.

Assumptions and key risks

The fee and the eight-week plan rest on these assumptions. Please confirm each one, or tell us where it differs. They are checked at M1 using the sample PDFs and WordPress access. If one proves wrong, the developer says so in writing before work continues, and any extra work follows the change process.

- Each issue is one PDF of up to 150 MB and about 120 pages, with five to twelve issues live at launch.
- MFW's WordPress API is switched on and reachable over HTTPS.
- The app text is in English only.
- MFW holds the Firebase project and organisation accounts with Apple and Google.
- News is written in WordPress. The admin panel adds app-level controls only.
- Readers download an issue before reading it. All editions are free to registered readers.
- MFW has the rights to all content, logos and images, and supplies the privacy policy.
- A small editorial team uses one admin role.
- Apple and Google store policies are as published today.

Risk	What we do about it
The page-turn effect runs poorly on low-end phones or heavy PDFs	A test on MFW's real PDFs in Week 2 with stated targets. A swipe and zoom reader is always built as the fallback. A paid component is used only with MFW's written approval.
Apple or Google account set-up is slow	Enrolment starts in Week 1 as an organisation. The developer guides each step.
A store rejects the app, or review takes long	Follow store guidelines and keep privacy details ready. M5 is not tied to review timing.
MFW's WordPress API is blocked or slow	Confirm access in Week 1, test early, and cache recent articles.
Feedback arrives late, or requirements change	One approver, one feedback list per round, written change requests.
Year-end holidays fall in Weeks 6 and 7	MFW names testers available from 28 December 2026. Availability dates are shared at kickoff.
This is a one-person project	Weekly commits to MFW's repository with notes, so another developer could continue. Short gaps are absorbed by the fee's allowance for the unexpected, and longer gaps move dates by the same amount.

Changes, handover and warranty

Defect or change

A **defect** is a failure against an acceptance criterion above. It is fixed at no charge. A **change** is anything else: a new feature, different behaviour after approval, a redesign of an approved screen, or an item listed under "Scope not included". A question that only clarifies the agreed scope is answered without a change request.

Change requests

1. **Request.** MFW's approver describes the change in writing. Email is enough.
2. **Impact assessment.** Within two working days the developer replies with the effort in person-days, the price at ₹2,500 per person-day, the effect on the dates, and any new third-party cost.
3. **Approval.** MFW approves in writing. No work starts before approval, and the original scope and dates stand until then.

4. **Delivery.** The change is built, tested and delivered. Unless agreed otherwise, 50% is invoiced on approval and 50% on delivery.

Handover

Handover is complete when criteria AC-11 and AC-12 are met. MFW receives:

- The source code for the app, backend and admin panel, in a repository owned by MFW.
- Technical documentation, including set-up, deployment steps, data model, security rules and third-party licences.
- A short administrator guide and a live training session of up to two hours.
- The release package: store listing text and screenshots, and the privacy inputs.
- Test evidence, a record of who holds each credential, and a list of known limitations.

The developer's access to MFW's accounts is removed when MFW asks after handover.

Warranty

The 30-day warranty starts on the day the app first becomes publicly available in a store, using the later date if the two stores differ. It ends no later than 60 days after submission.

Situation	Treatment
The app fails an acceptance criterion or differs from the approved design	Fixed at no charge. Critical and high defects are acknowledged within one working day.
A store rejects the app because of a defect in delivered features	Fixed and resubmitted at no charge
A store rejection that needs input from MFW, such as privacy wording	MFW supplies the input and the developer resubmits at no charge
A new feature, or different behaviour from what was approved	A change request
A Firebase, Apple, Google or WordPress outage, a new operating system version, a change made by MFW, or a content error	Not a defect. The developer helps diagnose it. Adapting the app is covered by a support plan or a change request.

After the warranty, the app keeps running on MFW's accounts. The code and documentation belong to MFW, so any competent Flutter and Firebase developer can maintain it.

Sign-off

By signing below, both parties agree to the scope, milestones, acceptance criteria and responsibilities in this Statement of Work. Changes are made only through the change process above.
